Biological Basis of PAR

PAR

Poly
(ADP-ribose)

Samuel Nalin,
Corbin Hopper

Biological Basis

The Model

Simulation
Results

- Poly(ADP-ribose) aka PAR
- PAR is a polymer that forms in many contexts, including DNA repair
- Catalyzed by PARP
- Digested by PARG

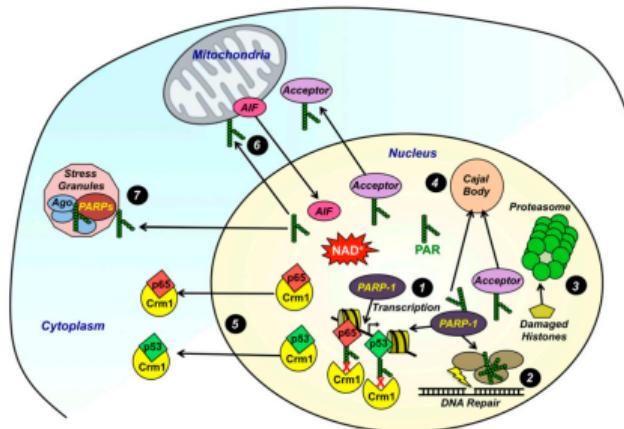

PAR

Poly (ADP-ribose)

- Proposed as very general stress response to temperature, inflammation, cancer, neurodegeneration...
 - Has a role in DNA repair, apoptosis, DNA regulation, RNA regulation, protein complex assembly...
 - Potentially forms spontaneous vesicles (liquid demixing)

Samuel Nalin,
Corbin Hopper

Biological Basis

PARG

Poly
(ADP-ribose)

Samuel Nalin,
Corbin Hopper

Biological Basis

The Model

Simulation
Results

- PARG cuts PAR trees by severing NAD-NAD bonds
- PARG inhibitors used in cancer treatments
- At first glance PARG just cleans up after PAR is done
- But decreased activity of PARG *delays* DNA repair and makes cells more susceptible to DNA damage

Elongation and Branching

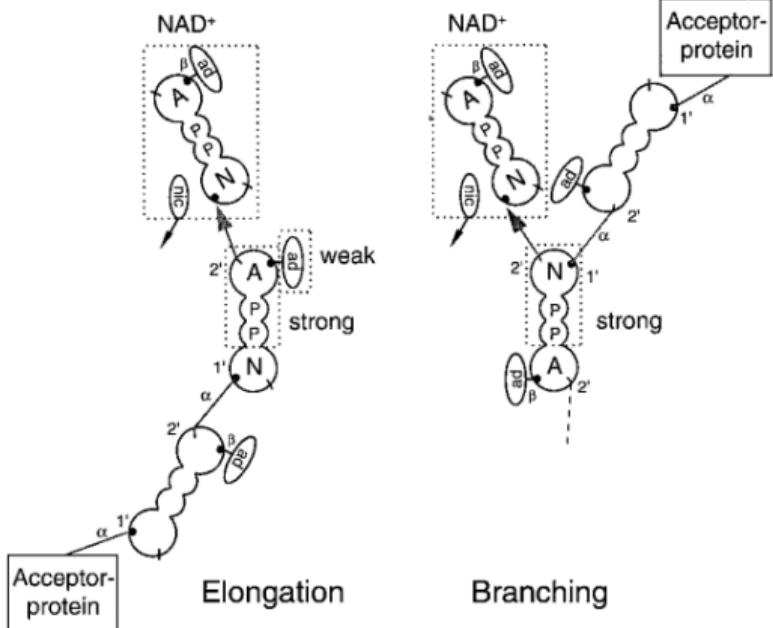

Poly
(ADP-ribose)

Simulation
Results

Elongation and Branching

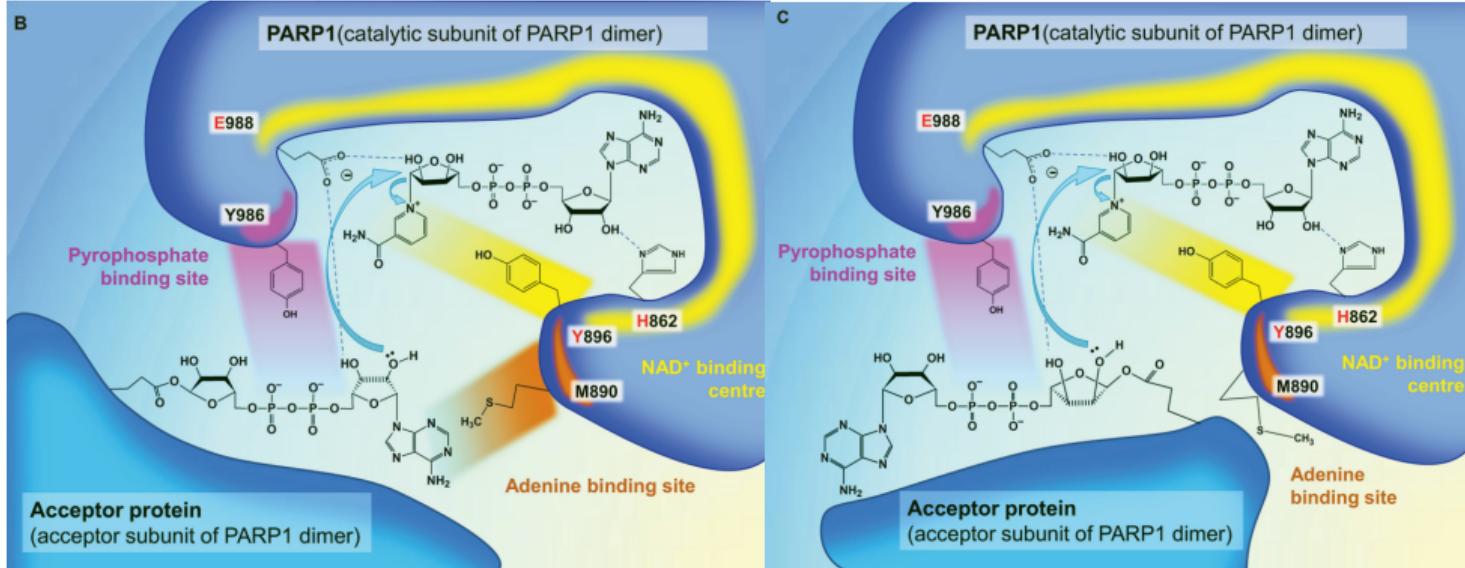

Poly
(ADP-ribose)

Samuel Nalin,
Corbin Hopper

Biological Basis

The Model

Simulation
Results

(a) Elongation

(b) Branching

Size Dependence on [NAD]

Poly
(ADP-ribose)

Samuel Nalin,
Corbin Hopper

Biological Basis

The Model

Simulation
Results

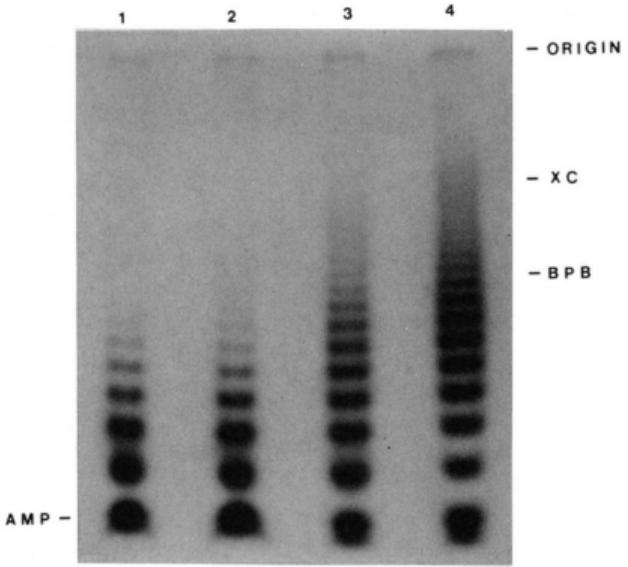

FIG. 2. Size distribution of ADP-ribose polymers synthesized with 1.8 pmol of pure enzyme at 200, 400, 800, and 1600 nm [NAD] (lanes 1, 2, 3, and 4, respectively). The electrophoretic migration of xylene cyanol (XC) ((ADP-ribose)₂₀) and BPB ((ADP-ribose)₈) are indicated to the right, and AMP to the left of the autoradiograph.

Branching Ratio

Poly
(ADP-ribose)

Samuel Nalin,
Corbin Hopper

Biological Basis

The Model

Simulation
Results

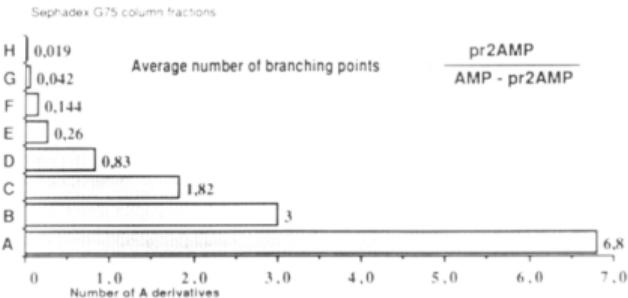

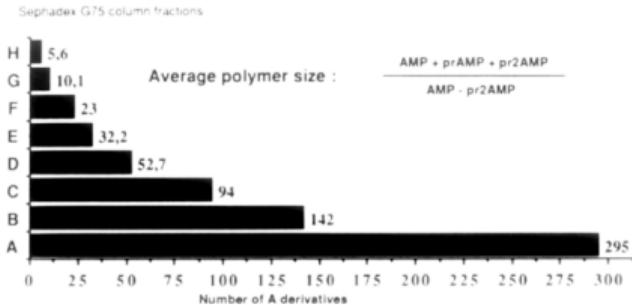

FIG. 5. Average polymer size and branching points of poly(ADP-ribose) fractions. A to H: fractions from G75 Sephadex column. The values were obtained by using the formulas shown.

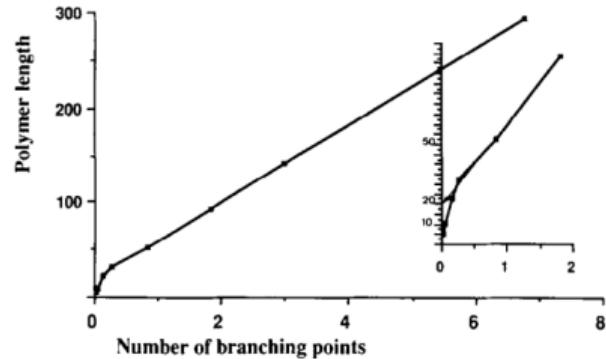

FIG. 6. Plot of polymer lengths versus number of branching points. The values correspond to those of Fig. 5.

The Kappa Model

Reactions

Poly
(ADP-ribose)

Samuel Nalin,
Corbin Hopper

Biological Basis

The Model

Simulation
Results

- Initiation: PARP binds to DNA to become active
- Should have 1 PARP per tree
- PARP can bind NAD in acceptor position or donor position
- doner NAD: leaf of a growing NAD tree
- acceptor NAD: free NAD⁺
- PARG cuts any two bound NADs
- All NAD chains separated from tree are digested at infinite rate

Elongation and Branching

Poly
(ADP-ribose)

Samuel Nalin,
Corbin Hopper

Biological Basis

The Model

Simulation
Results

- Donor side has pyrophosphate (P) and adenine (A) sites for PARP-NAD binding
- P binds independently, but A requires P already bound
- Elongation is more frequent.. and yet it requires more bonds
- $Pr(A|P|\bar{A}|P) \gg k_{catalysis} \cdot Pr(\bar{A}|A)$
- Consistent with unimolecular binding rates

Implementation

Poly
(ADP-ribose)

Samuel Nalin,
Corbin Hopper

Biological Basis

The Model

Simulation
Results

- Model in Kappa
- Housed in Kappy (python)
- Parameter variation via string replacement
- Plotting using matplotlib

Biological Basis

Simulation Results

[NAD] dependence

NAD concentration dependence without PARG.

Poly
(ADP-ribose)

Samuel Nalin,
Corbin Hopper

Biological Basis

The Model

Simulation
Results

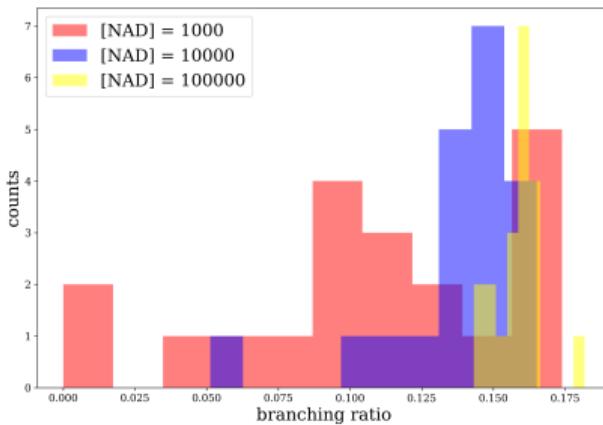

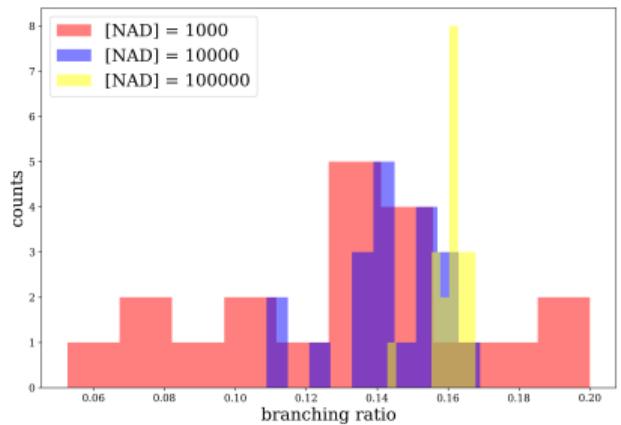

Figure: Branching ratios of all trees in absence of cutting mechanism

[NAD] dependence

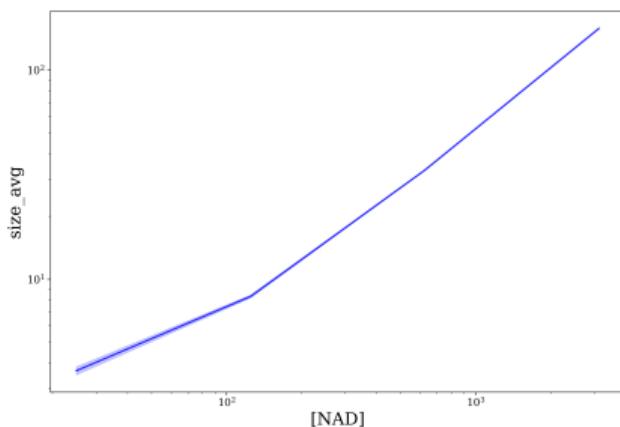

Poly
(ADP-ribose)

Samuel Nalin,
Corbin Hopper

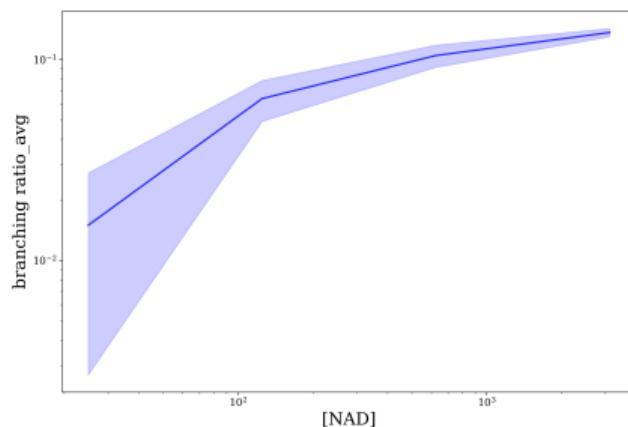

Biological Basis

The Model

Simulation
Results

(a) Average tree size

(b) Average tree branching ratio

Tree size over time

Evolution of tree size with time.

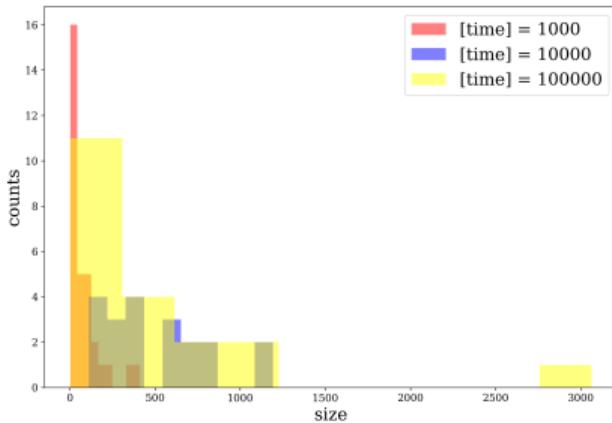

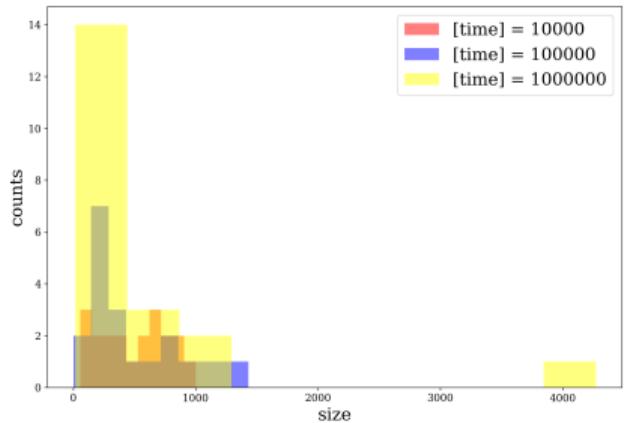

Figure: Size of all trees for different times ($[NAD]=10^4$)

PARG and Size

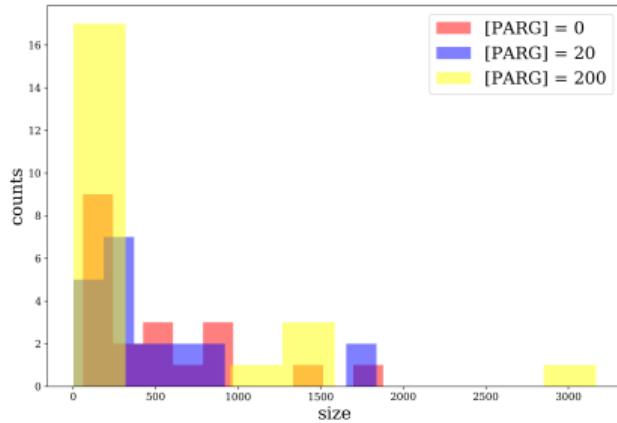

Poly
(ADP-ribose)

Samuel Nalin,
Corbin Hopper

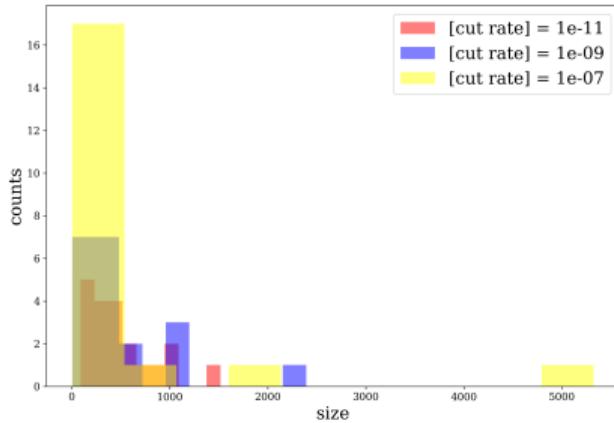

Biological Basis

The Model

Simulation
Results

(a) Tree sizes for different [PARG]

(b) Tree sizes for different cut rates

PARG and Size

Poly
(ADP-ribose)

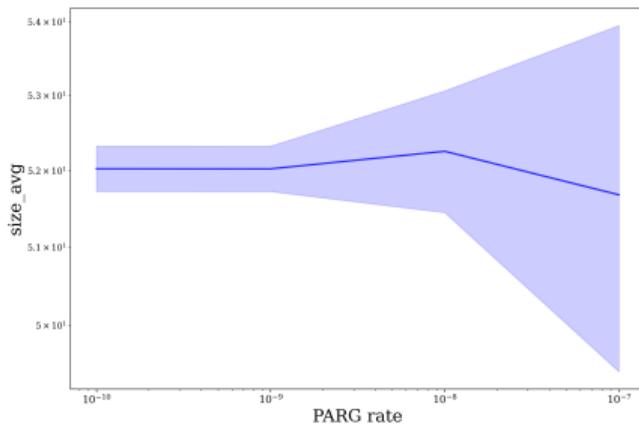

Samuel Nalin,
Corbin Hopper

Biological Basis

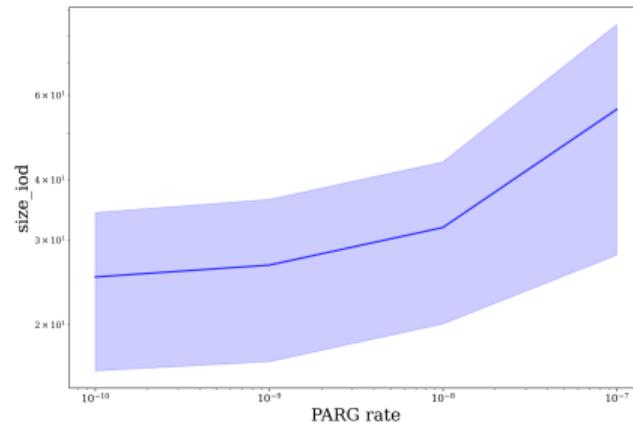

The Model

Simulation
Results

PARG kinetic rates with $[PARG] = 20$.

(a) Average tree size

(b) Index of Dispersion = $\frac{\sigma^2}{\mu}$ of tree sizes

PARG and Branching

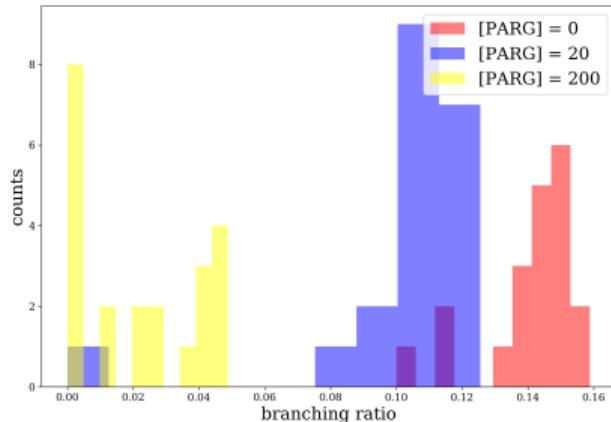

Poly
(ADP-ribose)

Samuel Nalin,
Corbin Hopper

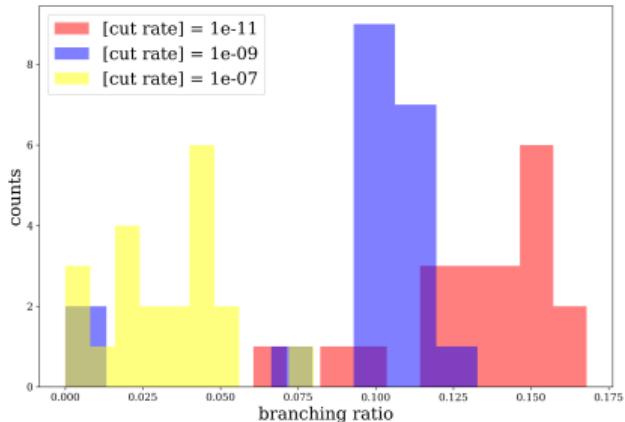

Biological Basis

The Model

Simulation
Results

(a) Tree branching ratios for different [PARG]

(b) Tree branching ratios for different cut rates

PARG and Branching

Poly
(ADP-ribose)

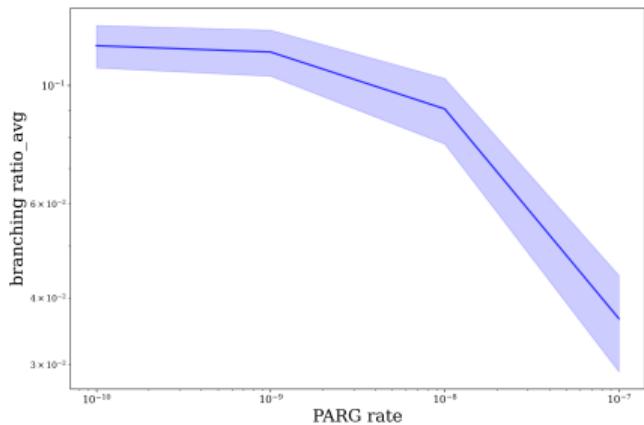

Samuel Nalin,
Corbin Hopper

Biological Basis

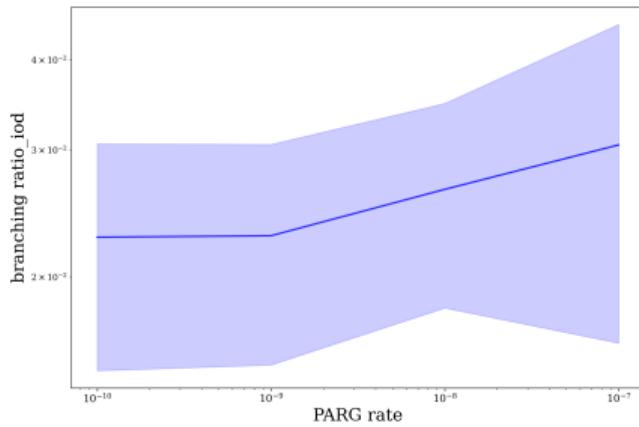

The Model

Simulation
Results

Various PARG kinetic rates for $[PARG] = 20$.

(a) Average tree branching ratio

(b) $IOD = \frac{\sigma^2}{\mu}$ of tree branching ratio
